September 2026

C O N F I D E N T I A L

PART I — TECHNICAL PROPOSAL

1. Overview

1.1 Introduction

The country has arrived at the point where artificial intelligence is no longer a forecast about work. It is a condition of work. In Gallup's May 2026 Workforce data, 52% of U.S. employees report using AI in their role at least a few times a year, the first reading above half.¹ Earlier 2026 findings also show growing concern about potential job loss due to AI or automation.² Adoption and unease are rising together.

What the country can already see is the adoption story. There is robust tracking of who uses AI, how often, and in which tools, alongside the labor-market aggregates that describe employment, wages, and productivity at a national scale. Those measures are necessary, and they are well built.

What decision-makers need next is a more complete, consistent view of the worker. Alongside adoption and economic measures, they need to know whether people feel secure, have a say in how tools arrive in their jobs, know what skills a move would require, and can access relevant retraining. They also need to see how these experiences differ across states, industries, employment arrangements and communities.

Existing evidence shows why those differences matter. In Gallup's August 2025 survey, 76% of employees in technology or information systems reported using AI at least a few times a year, compared with 33% in retail.³ In February 2026, employees in organizations that made AI available were nearly twice as likely to use it frequently when they strongly agreed that their manager actively supported its use.⁴ Separately, a January 2026 Brookings analysis estimated that 6.1 million workers were in occupations with high AI exposure and low adaptive capacity.⁵ This is an estimate of potential vulnerability, not a count of workers displaced by AI.

¹ Gallup, [Artificial Intelligence indicator](#). May 2026 measurement; U.S. adults employed full or part time for an organization. Total use means a few times a year or more. Accessed September 11, 2026.

² Andy Kemp, Gallup, [Rising AI Adoption Spurs Workforce Changes](#), April 12, 2026. Fieldwork: February 4-19, 2026; 23,717 U.S. employees. The job-loss item refers to AI or automation within five years.

³ Andy Kemp, Gallup, [AI Use at Work Rises](#), December 14, 2025. Fieldwork: August 5-19, 2025; 23,068 employed U.S. adults. Industry figures measure use at least a few times a year.

⁴ Andy Kemp, Gallup, [AI in the Workplace: What Separates Adopters and Holdouts](#), April 12, 2026. Fieldwork: February 4-19, 2026. Among employees in organizations making AI available, frequent use was 78% with strong agreement on manager support versus 44% otherwise.

⁵ Sam Manning, Tomas Aguirre, Mark Muro and Shriya Methkupally, Brookings, [Measuring US workers' capacity to adapt to AI-driven job displacement](#), January 21, 2026. The 6.1 million estimate identifies occupations in the top quartile of AI exposure and bottom quartile of adaptive capacity; it is not a displacement count.

52% U.S. employees using AI at work at least a few times a year May 2026	76% / 33% AI use in technology / information systems versus retail August 2025	6.1M workers in high-exposure, low-adaptive-capacity occupations Brookings, January 2026
--	--	--

Governors are asking what the picture looks like in their state. Workforce boards are asking which populations to prioritize. Funders are asking where retraining investments can address the greatest barriers. Employers are asking what responsible adoption requires. The opportunity is to give these leaders a recurring evidence base that brings workers' experiences, training access and transition capacity together, with a national benchmark and a consistent state-level reporting framework.

1.2 The gap: an integrated, long-term record of the worker experience

Existing research provides important evidence on AI adoption, workers' attitudes and occupational exposure. This initiative will build on that work rather than duplicate it, bringing three elements into a single recurring measurement program: coverage of different kinds of workers, state-level visibility and direct measurement of transition capacity.

Scope and scale. The study will measure self-employed and gig workers, employees of small and large employers, and non-employed adults using a common instrument and reporting framework. Repeating that framework annually will make it possible to examine changes within these populations, rather than relying only on national averages or isolated snapshots.

Geographic visibility. A dedicated sample in all 50 states will provide selected statewide indicators alongside the national benchmark. Regional and urban-rural analyses will be conducted where sample sizes support them, with the definitions and limits of each comparison documented. The purpose is to make the findings useful to leaders responsible for workforce decisions in specific places.

Transition capacity. Occupational exposure measures help identify where AI could change tasks. This study will complement them with workers' own reports of the skills they need, their access to training, the barriers they face and the alternatives they believe are available. Two workers with similar exposure may have very different resources and opportunities to adapt; the study will make those differences more visible.

1.3 The solution: a worker-centered national indicator

The Rockefeller–Gallup AI Initiative is designed to become a trusted recurring source on how artificial intelligence is reshaping Americans' experience of work. It combines a probability-based national survey, a separate state-level measurement component in all 50 states, and quarterly national tracking of faster-moving measures. Together, these components will give leaders a consistent basis for understanding change and informing workforce decisions.

Scope and scale. Each year, Gallup will survey approximately 10,000 U.S. adults through its probability-based Gallup Panel. The design will support analysis by employment arrangement, including self-employment and gig work, employer size, employment status and major industry group, subject to achieved sample sizes and reporting standards.

Geography. In addition to the national Gallup Panel sample, Gallup will target 500 completed interviews in each of the 50 states. Statewide reporting will focus on selected core measures; within-state subgroup analyses will be produced where sample sizes and data quality support them.

Establishing trends. Gallup will develop a stable core module for long-term tracking and a rotating module that keeps the instrument current as AI evolves. Comparable questions, population definitions and fielding periods will support interpretation of year-over-year change.

Designed to inform the national conversation. Each annual cycle will include a launch event at Gallup's Washington, DC headquarters, a launch report and Gallup.com article, a comprehensive report, and shorter releases supported by quarterly data. Coordinated media outreach will sustain attention between annual releases and help leaders use the findings throughout the year.

1.4 Project Aims

The markers Gallup watches for public indicators, and the terms on which this program should be judged:

Policymaker use	Use and reference by federal and state workforce, labor and economic-security offices, supported by the state-level findings.
Academic citations	Research use and citation of the published time series, aggregate tables and methodology documentation.
Media mentions	A recurring, quotable, human-centered data point on AI's labor effects, placed in target publications.
Convening presence	The data cited on the stages that set the agenda, with worker voice carried into them.

2. Project Approach

2.1 Project Kick-Off and Alignment

Within the week following contract execution, Gallup will convene a kick-off and topic-alignment session with the Foundation. Gallup's AI-focused economists and workplace scientists participate directly so the people who will shape the instrument hear the Foundation's priorities firsthand.

Through the session, Gallup will align on priority topics, the analytical framework, program success measures, the release plan and working arrangements: named leads on both sides, the review calendar and expected turnaround times. The sampling plan, quarterly wave sizes and reporting thresholds will be confirmed before fielding.

Gallup will hold a standing status call, weekly through instrument development and fielding, biweekly through analysis and reporting.

2.2 Survey Instrument Development

The instrument will be grounded in what already exists, shaped by experts, tested on live respondents, and reviewed with the Foundation before fielding.

Desk research and literature review. Gallup begins by assessing its own related knowledge and databases — the American Job Quality Study conducted with Jobs for the Future, the Gallup–SCSP read on American attitudes toward AI, and Gallup’s Workforce AI indicators — alongside external datasets and questionnaires from federal, academic, and philanthropic sources. The purpose is specific and consequential: to confirm, before a new item is written, exactly where the study fills a genuine gap rather than re-measuring something already on the record. This is the step that protects the Foundation’s investment from funding a redundant measure.

Expert consultation. Gallup will consult its internal economists, workplace scientists and survey researchers to inform the design. Additional consultation with members of Gallup’s Senior Scientist council may be arranged based on the expertise needed and availability. The Foundation may nominate experts from its own network. Individual advisory and public-facing roles will be confirmed before they are included in the delivery or event plan.

Foundation review gate — topic areas. Gallup drafts the topic areas and submits them for the Foundation’s review before any items are written, so that the study is aimed at the right questions from the start.

Draft instrument. Using established best practices in survey design and measurement, Gallup drafts the full instrument and provides it to the Foundation for review.

Gallup will develop an employed module and a non-employed module covering aspirations and barriers to work. Up to half of the instrument will be designated for long-term tracking, with a rotating module refreshed annually. Early testing will refine new measures before they become established trend items. Any subsequent change to a core item will be documented, with comparability assessed before it is treated as part of an existing trend.

Cognitive interviews. Once the Foundation is comfortable with the items, Gallup conducts cognitive interviews in which live respondents work through the instrument, confirming that each item is understood as intended and that the burden on the respondent is reasonable.

Programming and QA. Gallup will program the finalized instrument on its standard hosting platform, using a mobile-first design and testing routing, response options and language versions before fielding.

2.3 Sampling

2.3.1 National Sample

For national-level data collection, Gallup will use sample from its proprietary, probability-based Gallup Panel.

The Gallup Panel the largest probability-based panel in the United States, comprising approximately 100,000 households recruited through random sampling rather than self-selection. Panel members are recruited using random-digit-dial and address-based sampling, which is the property that makes the resulting estimates projectable to the U.S. adult on age, gender, education, race and ethnicity, and geography supports sample selection, nonresponse assessment and weighting. The national estimates will be weighted to the eligible U.S. adult population, with coverage and nonresponse limitations documented.

The national design targets approximately 10,000 completed interviews from a stratified random sample of eligible panel members, with strata defined by Census region. For planning, the annual national and state samples will cover U.S. adults aged 18 and older. The proposed workforce-focused analytical groups are ages 25-64 and early-career adults ages 20-24. Adults ages 18-19 and 65 and older remain eligible, with separate age-group reporting where sample sizes permit. Final age allocations will be confirmed in the sampling plan.

Analysis will distinguish wage-and-salary employees at small and large employers, self-employed and gig workers, and non-employed adults, including those seeking and not seeking work. The analytical plan will define employer-size thresholds and overlapping employment arrangements. Annual waves will measure change in population estimates; following the same individuals through employment transitions is not included unless separately scoped.

For planning purposes, the table below shows approximate 95% margins of sampling error for the probability-based national sample, using the illustrative assumptions specified in the note.

Reporting group	Approximate base	Approximate margin of error*
All national respondents	10,000	±1.5 points
Employed workers	~7,000	±1.8 points
Non-employed adults	~2,500–3,000	±2.7-3.0 points
Gig and self-employed workers	~1,000–1,200	±4.3-4.8 points
Major industry groups	~500–800**	±5.3-6.7 points

*Illustrative calculations assume a percentage estimate of 50% and a design effect of 2.35. Ranges reflect the stated sample-size ranges. Subgroup bases are projected. Final uncertainty will reflect achieved sample sizes, weighting and estimate-specific design effects.

**Per industry group. Employment-arrangement groups may overlap; their bases should not be added together.

2.3.2 State-Level Sample

Gallup will field the same core instrument through a vetted consumer-panel partner, targeting 500 completed interviews in each of the 50 states, or 25,000 interviews in total. The sampling plan will identify the provider, recruitment method, eligibility rules, quotas and quality controls, and will state explicitly whether selection is probability-based or nonprobability. State samples will be weighted to appropriate demographic benchmarks for each state's eligible population.

Statewide reporting will cover selected core measures. Within-state subgroup estimates will be released only where achieved sample sizes, effective bases and data quality meet the reporting thresholds established before analysis. No conventional margin of sampling error is assumed for the consumer-panel component. Any reported precision measure will be tied to a documented probability design or, for a nonprobability sample, an explicitly described model and its assumptions.

National and state samples will be analyzed separately; consumer-panel responses will not be pooled into the probability-based national benchmark. Gallup will align question wording, population definitions and fielding periods, assess comparability across sources, and explain any limitations on state-versus-national comparisons. State differences will not be presented as precise rankings when the design and uncertainty do not support that interpretation.

2.4 Data Collection

Once the survey is finalized, Gallup's web programmers will program the instrument using best practices in web survey design, including mobile optimization. Gallup will test the programmed survey and provide the Foundation with a test link and access codes for review before each administration. The fielding plan will document how eligible online and offline Gallup Panel members can participate and any resulting coverage limitations.

For the national sample, respondents will receive a Gallup invitation with a unique, secure access code. Gallup will use reminders and respondent incentives consistent with its panel procedures. State-panel invitations, incentives and access controls will follow the approved partner fielding plan. Gallup will test skip patterns and rotations, monitor completion patterns and response quality, and provide weekly fielding updates, with more frequent updates when needed.

The survey will take approximately 15 minutes to complete online. Gallup will provide the option for respondents to take the survey in both English and Spanish.

2.5 Analysis

Processing. After fielding, Gallup will clean and quality-assure the dataset, applying pre-specified checks for straight-lining, speeding, logical consistency and valid ranges. Processing

will include construction and verification of derived variables and coding of open-ended responses included in the instrument.

Weighting. Gallup will weight the national sample to appropriate U.S. population benchmarks and the state samples to corresponding state benchmarks. Documentation will describe nonresponse and calibration adjustments, achieved bases, effective sample sizes, and the uncertainty methods appropriate to each sample. National and state estimates will retain distinct source identifiers.

Analytical framework. Gallup will examine the relationships among reported AI use and changes at work, job security, knowledge of needed skills, access to training, personal and structural barriers, and perceived alternatives across roles and sectors. The analysis will show which populations report both greater disruption or insecurity and fewer resources to adapt, and how these patterns differ by employment arrangement, industry and geography where reporting standards are met.

Transition capacity will initially be reported through its component measures rather than assumed to be a validated index or set of tiers. Any composite measure will require an agreed specification, assessment of reliability and validity, and transparent documentation before public use. The analysis will distinguish respondents' experiences and perceptions from causal evidence; the survey alone will not establish that AI caused a job loss or an employment transition.

Data deliverables. Gallup will provide the Foundation with a de-identified, cleaned, weighted, analysis-ready dataset and derived variables in the agreed format or formats selected from SPSS, SAS, Stata and R; a codebook and data dictionary; and a methodology report covering sample design, fielding outcomes, applicable AAPOR response or participation-rate definitions, weighting, uncertainty and study limitations. Gallup will also provide weighted topline and agreed cross-tabulations. Direct identifiers will be excluded, and disclosure risk will be assessed before delivery.

2.6 Launch Report and Gallup.com Article

Following the data analysis phase, Gallup researchers will work with the Foundation team to identify the most important findings resulting from the research. Gallup will prepare the launch report (approximately ten pages in length), inclusive of key findings, narrative supporting these insights and related graphics. The report will be developed using an iterative approach in which Gallup outlines, drafts and finalizes the report based upon feedback from the Foundation team.

Alongside the report, Gallup will publish a Gallup.com launch article. Gallup's writers and editors will develop accessible, evidence-led reporting for a broad audience, with research conclusions and publication governed by Gallup's scientific and editorial standards. The launch article is included in the six-article annual program described in Section 2.10.

Gallup will create and maintain a dedicated research hub on Gallup.com as the continuing public home for the initiative. It will organize annual reports, quarterly findings, published state tables and methodology documentation by release year. Standard content updates for the agreed

releases are included in the recurring program; custom dashboards, interactive tools or additional digital products would require separate scope and pricing.

2.7 Annual Launch Event - Gallup's Washington, DC Headquarters

Gallup will host an inaugural summit at Gallup World Headquarters in Washington, DC, to launch the study's findings and convene employers, policymakers, researchers, workforce development leaders, philanthropic organizations and worker representatives. One launch convening at Gallup's headquarters is included in each subsequent annual cycle, with its format and scale confirmed during annual planning. Discussions will connect national findings and selected state indicators to workers' job security, career prospects, skills and opportunities to navigate the transition.

The summit will connect the research to the decisions facing leaders: where to prioritize workforce investments, how to expand access to relevant training, and what responsible AI adoption requires from employers. Worker perspectives will be central to the conversation, bringing attention to both the opportunities AI creates and the barriers people face in adapting to change or entering the workforce. Designed as a forum for exchanging evidence and practical approaches, the summit will help leaders use the findings to inform policies, investments and employer practices that support access to good jobs in an AI-driven economy.

Gallup will manage the venue, production, invitations, run-of-show, spokesperson preparation, on-site press coordination and post-event asset capture within the agreed event plan and budget. Speaker participation will be confirmed individually. Any paid media partnership, additional event production or expanded event scope will require separate approval and pricing.

2.8 Amplification and Strategic Communications

Gallup will collaborate closely with the Foundation's communications team to ensure alignment and maximum exposure of the research. Gallup will create a targeted media list to roll out research highlights and work with relevant media contacts to widely disseminate the report results. Gallup will strategically craft pitches to media outlets after identifying key messaging to amplify the most newsworthy findings to a broad audience. Gallup will collaborate with the Foundation communications team on the best messaging and coordinate outreach to drive impactful conversations around the topic.

Gallup's strategic communications team will contribute during instrument development by identifying questions of public relevance and opportunities to make the resulting research useful to policymakers, employers and the media. Survey design, analysis and reporting will remain grounded in Gallup's research standards, with findings and conclusions determined by the evidence. Early media engagement may inform audience needs and dissemination planning, but will not predetermine questions, results or conclusions.

2.9 Quarterly Data Collection — Gallup Poll Social Series

WHAT THIS PHASE SECURES FOR THE FOUNDATION

A fresh number every quarter, at low marginal cost, on an established vehicle — and with it, the within-year trend that annual-only studies miss and the fuel that keeps the study in the conversation between flagship releases.

Between annual waves, a short tracking module will field four times per year to capture measures that may change within the year: AI use at work, comfort and confidence, perceived job-loss risk, and job-search and preparation behavior. These updates will complement, rather than replace, the annual national and state-level study.

The approximately three-minute module will be included in the Gallup Poll Social Series, a recurring national survey program of U.S. adults aged 18 and older with an established demographic battery and fielding infrastructure. At kick-off, Gallup will confirm the expected total and employed-respondent bases for each wave, the available fielding slots and planning precision. These specifications will be documented before fielding; analysis will use the achieved bases and the relevant population for each question.

Quarterly results will support national reporting. Broad worker-level comparisons will be made only where achieved sample sizes and data quality permit. The quarterly component does not support state estimates or narrow industry cuts; detailed reporting of that kind will rely on the annual study and its reporting thresholds. Annual-to-quarterly comparisons will use matched question wording and population definitions, with any mode, sample or timing differences disclosed.

Within two weeks of each wave's close, Gallup will deliver a weighted topline, a de-identified weighted dataset and a short findings memo. The memo will compare results with the prior comparable wave and annual baseline, distinguish statistically supported changes from descriptive differences, and report uncertainty and relevant limitations. A stable result will be reported as such rather than treated as evidence of movement.

The proposed first-year fielding windows are February, May, July and October 2027, supporting articles in March, June, August and December. The first-quarter wave may also inform the April comprehensive report; the summer wave will inform the next annual instrument review. The fall wave will provide an update ahead of the next annual launch. Exact slots will be confirmed against the host survey calendar, as shown in Section 4.

2.10 Ongoing Reporting

Gallup.com article series. Each annual cycle will include six articles in total: the January launch article, a February article drawing on additional annual findings, and four articles informed by quarterly tracking in March, June, August and December. Each article will address a distinct finding or development rather than repeat the launch narrative. The Foundation will review drafts for accuracy, context and partnership alignment; Gallup will retain responsibility for research

conclusions and final Gallup.com editorial decisions. Branding and review turnaround times will be agreed at kick-off.

Comprehensive report. Each April, Gallup will produce one comprehensive report containing a national synthesis and a consolidated appendix of selected core estimates for all 50 states. The report will include comparisons by employment arrangement and major industry where supported, state-versus-national context with methodological qualifications, and an explanation of transition-capacity measures. The outline, indicator set and approximate length will be agreed before drafting. The scope is a single report with state tables, not 50 standalone narrative reports.

Social Media Content and Amplification. Gallup will create a series of social media posts following launch to be disseminated on official Gallup channels. Gallup will also dedicate a Gallup Podcast episode to highlight the findings.

Amplification will follow the full-year release calendar: a concentrated launch-week effort, follow-up articles in February and March, renewed outreach around the April comprehensive report, and additional outreach for the June, August and December quarterly articles. Social media content and research-hub updates will accompany agreed releases. Media outreach is included; placement and coverage decisions remain with independent outlets.

2.11 Annual Data Collection and Reporting

The Rockefeller–Gallup AI Initiative will establish a recurring annual benchmark of how Americans are experiencing AI's impact on work and whether they have the resources and opportunities to navigate the transition. Year One will establish the national and state-level baseline. Each subsequent year will show how workers' experiences are changing, where gaps are widening or narrowing, and whether access to training and pathways to new work is keeping pace with adoption. The value of the partnership will grow with each annual cycle, creating a consistent record that policymakers, employers and funders can use to inform decisions.

Gallup will repeat the national and state-level data collection annually, targeting approximately 10,000 national interviews through the probability-based Gallup Panel and a separate consumer-panel sample of 500 interviews in each state. A common annual fielding window and stable core questions will support comparisons over time. Reporting will distinguish the national and state sampling approaches and apply consistent subgroup thresholds, including for non-employed adults.

Each year, Gallup will review the instrument with the Foundation, preserving core questions on AI experience, job security, skills and training access, and transition capacity while refreshing the rotating module. The recurring fees include this annual review, development and testing of refreshed items within the agreed 15-minute instrument, and associated programming updates. Material changes to length, sampling or analytical scope would require an agreed change in scope and pricing.

The annual cycle will follow a repeatable sequence: autumn instrument review and fielding; a January launch convening, report and article; an April comprehensive report; and six Gallup.com

articles across the year, including the launch article. Beginning in Year Two, reporting will emphasize changes from the prior annual wave and baseline, identifying where experiences, opportunities and barriers are improving, worsening or remaining stable. State comparisons will be interpreted within the documented limits of the state and national designs.

Four quarterly waves will provide timely national updates between annual releases, while the annual study remains the basis for state reporting and supported industry analyses. Together, the two cycles will sustain a year-round program of findings, social content and targeted outreach. The next annual instrument review and fielding will begin as the current cycle's quarterly reporting concludes, building a cumulative record rather than a series of disconnected studies.

3. Team

Gallup will lead instrument design, sampling, fielding, analysis and communications through a coordinated project team. The roles below describe the proposed staffing model; assignments, advisory participation and event appearances will be confirmed at kick-off. A named day-to-day project manager will maintain the delivery calendar, coordinate reviews and escalate risks to the partnership lead.

Lead	Role on the Initiative
Justin Lall Principal	Proposed partnership lead and primary Foundation contact. Oversees scope, delivery and cross-team coordination, supported by a day-to-day project manager named at kick-off.
Jim Harter, Ph.D. Chief Scientist, Workplace	Anchors instrument design and the worker-experience framework. Leads Gallup's workplace management and wellbeing science; author or coauthor of more than 1,000 workplace studies, including the largest ongoing meta-analysis of engagement and performance.
Jonathan Rothwell, Ph.D. Principal Economist	Grounds the study in the economics of work and employment transitions. Advises the transition-capacity framework and interpretation of reported experiences alongside relevant labor-market context.
Christos Makridis, Ph.D. Economist	Strengthens the economic framing and the measurement of the AI transition, working at the intersection of technology, labor, and wellbeing with an extensive publication record on AI and the workforce.
Kristjan Archer Senior Communications Leader	Leads strategic communications and amplification for the initiative.
Jenny Marlar, Ph.D. Director of Survey Research	Owens the sample design and the weighting that make the national and state-level reads defensible. Specializes in probability-based panel research, sampling, and reaching low-incidence and hard-to-reach populations.
Camille Lloyd Director, Center on Black Voices	Provides insights and expertise from Gallup's Center on Black Voices, which has longstanding trends on jobs and work, wellbeing, and community.
Jon Clifton CEO	Supports institutional visibility and amplification. Any participation in the annual launch will be confirmed through the event-planning process.

Gallup may draw on its Senior Scientist council for targeted consultation when relevant and available. Participation by external advisers will be confirmed individually; the core delivery plan does not depend on an unconfirmed advisory or speaking commitment.

THE STANDING INFRASTRUCTURE BEHIND THE INITIATIVE

The initiative will build on Gallup's probability-based Panel, workplace and wellbeing research, existing AI measures, and experience maintaining recurring public indicators. This infrastructure supports consistent measurement, integrated research and communications, and a program that can accumulate value over successive annual cycles.

4. Timeline and Review Gates

The proposed schedule begins in late September 2026 and targets a January 18-22, 2027 launch, approximately 16 weeks after kick-off. The table distinguishes fieldwork, Foundation deliverables and public releases. Quarterly slots and publication dates will be confirmed at kick-off; timely review and approval of fielding materials are required to maintain the schedule.

Dates	Activity and output
Sep 21, 2026	Planning: contract finalization; teams, resourcing and release plan confirmed.
Sep 28-Oct 2, 2026	Kick-off: topic and analytical-framework alignment; sampling, quarterly bases, review gates and deliverable specifications confirmed.
Oct 5-9, 2026	Instrument development: draft 1, including employed and non-employed modules.
Oct 12-16, 2026	Foundation review: draft 1 and proposed analytical framework; feedback incorporated before fielding.
Oct 19-23, 2026	Testing and finalization: cognitive interviews, final instrument and analytical-plan confirmation.
Oct 26-30, 2026	Programming and QA: national survey and state-partner implementation; Foundation test-link review.
Nov 9-27, 2026	Fieldwork: annual national Gallup Panel sample and all 50 state samples.
Nov 30-Dec 11, 2026	Processing: data-quality checks and separate national / state weighting.
Dec 14-23, 2026	Foundation deliverables: weighted topline and cross-tabulations; launch-report outline and methodological review.
Jan 4-8, 2027	Foundation deliverable: launch-report draft 1.
Jan 11-14, 2027	Foundation review: launch-report draft and launch materials; revisions finalized.
Jan 18-22, 2027	Public launch: Washington, DC convening, approximately 10-page launch report and Gallup.com article 1; research hub opens.
February 2027*	Fieldwork: Q1 tracking. Foundation receives weighted topline, de-identified data and a findings memo within two weeks of close.
February 2027	Public release: Gallup.com article 2, drawing on additional annual findings.
March 2027	Public release: Gallup.com article 3, informed by Q1 tracking.
April 2027	Public release: comprehensive national report and 50-state core-indicator appendix, with Q1 updates where relevant.
May 2027*	Fieldwork: Q2 tracking. Foundation receives weighted topline, de-identified data and a findings memo within two weeks of close.

Dates	Activity and output
June 2027	Public release: Gallup.com article 4, informed by Q2 tracking.
July 2027*	Fieldwork: Q3 tracking. Foundation receives weighted topline, de-identified data and a findings memo within two weeks of close.
August 2027	Public release: Gallup.com article 5, informed by Q3 tracking.
September 2027	Year Two annual cycle begins: instrument review and rotating-module development, informed by the annual study and available quarterly findings.
October 2027*	Fieldwork: Q4 tracking. Foundation receives weighted topline, de-identified data and a findings memo within two weeks of close.
November 2027	Year Two fieldwork: second annual national and 50-state data collection, supporting the next January launch.
December 2027	Public release: Gallup.com article 6, informed by Q4 tracking and closing the first annual reporting cycle.

*Quarterly fielding months are proposed and subject to confirmation of Gallup Poll Social Series availability. Autumn 2027 annual development and fielding belong to Year Two; the remaining 2027 quarterly releases belong to the first reporting cycle. These are distinct activities, not duplicate annual-survey charges.

PART II — BUDGET

5. Investment

5.1 Assumptions

The investment covers one annual national survey targeting 10,000 interviews; 500 interviews in each of 50 states; a roughly 15-minute English- and Spanish-language instrument; data processing, weighting and analysis; an approximately 10-page launch report; one comprehensive report with state tables; four three-minute quarterly modules; six Gallup.com articles in total; and one annual launch convening. Communications, agreed social content, a podcast episode and standard research-hub updates are included in the recurring program described above.

Year One covers the initial instrument build, late-2026 annual fieldwork and the first launch and quarterly reporting cycle in 2027. Year Two includes the next annual instrument refresh and fieldwork beginning in autumn 2027 and its associated launch and reporting cycle. Successive cycles overlap operationally, but each annual survey, quarterly wave and release is included once in its assigned program cycle.

5.2 Year One Cost Detail

Phase	Investment
Initial design and development (one time)	\$110,300
Annual national data collection - Gallup Panel, n=10,000	\$310,500
Annual state collection - 50 states x 500 interviews, n=25,000	\$647,600
Data processing, QA, weighting and analysis	\$230,000
Annual launch report development	\$49,200
Comprehensive report and consolidated state tables	\$86,400
Four quarterly tracking waves and six Gallup.com articles in total	\$424,000
Annual launch convening at Gallup World Headquarters	\$54,000
Total Year One Investment	\$1,912,000

5.3 Multiyear Investment and Recurring Scope

The \$110,300 initial design-and-development charge applies in Year One only. The recurring annual base of \$1,801,700 covers instrument review, refreshed-item development and testing, programming updates, and the annual collection, analysis, reporting, quarterly tracking, communications and convening described in Section 2. These activities do not require a second initial-development charge.

Year Two is priced at the recurring base without escalation. Beginning in Year Three, each annual fee increases by 3% over the preceding year's rounded fee. Amounts are rounded to whole dollars, and the five-year total sums the displayed amounts. Material expansion of survey length, sample, analytical products or event scope requires separately agreed scope and pricing.

	Year 1	Year 2	Year 3	Year 4	Year 5	Five-year total
Core program	\$1,912,000	\$1,801,700	\$1,855,751	\$1,911,424	\$1,968,767	\$9,449,642
